

ELASTUK

Sigillante in strisce preformate facilmente comprimibile, assicura perfetta tenuta ad acqua e aria in guarnizioni tra vetro, metallo, legno e materie plastiche.

MODO D'USO: Applicare il preformato sul supporto, esercitando una leggera pressione, quindi rimuovere la carta protettiva e assemblare le parti. Dato il carattere elastoplastico, il sigillante deve sempre lavorare in leggera compressione.

It is a preformed stripe dope, white or grey/black on request, easily compressible, ensuring a perfect airtight and watertight when it joints glass, metal, wood and plastic materials. It is an excellent steam barrier when used in the assembly of gaskets in heating and conditioning systems, as well as in the installation of hydraulic and sanitary equipment or fixtures. It keeps without hardening and preserves its plasticity all over the years.

INSTRUCTION FOR USE: Put the stripe on the support exerting a light pressure. Then remove the protection paper and join the parts. A light pressure on it must always be exerted.
